Method and system for constraint checking bulk data in a database
Verfahren und System um Bedingungen für Massen von Daten in einer Datenbank zu überprüfen

Procédé et système pour vérifier des contraintes pour des grandes quantités de données dans une base de données

PATENT ASSIGNEE:

INTERNATIONAL BUSINESS MACHINES CORPORATION, (200123), , Armonk, NY
10504, (US), (applicant designated states: DE;FR;GB)

INVENTOR:

Cochrane, Roberta J., 52 Chester Street, Los Gatos, California 95030,
(US)
Pirahesh, Mir H., 1282 Quail Creek Circle, San Jose, California 95120,
(US)
Sidle, Richard S., 141 Davisville Avenue, Apt. 1712, Toronto, Ontario M4S
1G7, (CA)
Zuzarte, Calisto P., 1625 Fairfield Crescent, Pickering, Ontario L1V 6H2,
(CA)

LEGAL REPRESENTATIVE:

Jennings, Michael John (80331), IBM United Kingdom Limited, Intellectual
Property Department, Hursley Park, Winchester, Hampshire SO21 2JN, (GB)
PATENT (CC, No, Kind, Date): EP 726537 A1 960814 (Basic)
APPLICATION (CC, No, Date): EP 96300875 960209;
PRIORITY (CC, No, Date): US 387037 950210
DESIGNATED STATES: DE; FR; GB
INTERNATIONAL PATENT CLASS: G06F-017/30;
ABSTRACT WORD COUNT: 164

LANGUAGE (Publication,Procedural,Application): English; English; English

...SPECIFICATION table containing all the departments in an employing organization. The second table, in this case, is the "parent table". The **unique** identifying **column** in the parent table identifying department titles is referred to as a "primary key". Referential integrity is the state when...

...the above simple example shows a foreign and primary key having only one column, referential integrity can be assured using **multi - column keys**.

In the above example, the record for the employee having no department is said to be "orphaned" because the foreign...foreign key establishes a "referential" relationship between the base-table (child) and another (parent) table designated by the foreign key **column** attribute. An **unique** key is a set of **columns** whose values **uniquely** determine a record in the table, so a primary key is, by definition, an unique key. Thus, a parent/child...

...be added without limit and each key attribute may span several columns.

Generally speaking, a referential constraint relates a possibly **multi - column** foreign **key** from the child table to an unique key in the parent table. There is only one primary key in a...

Detailed Description

Detailed Description

... having to

reorganize the tables. Each table, also referred to as a relation, contains one or more data categories in **columns**. Each row in the table contains a **unique** data record or instance of data for a data object represented by the categories defined by the **columns**. Each row in the table is **uniquely** identified by a primary key, which may be any **column** or **columns** in the table that **uniquely** identifies a row. Typically, a table will contain a **column** to hold **unique** integer values to act as a default primary key. The integer values may be automatically assigned by the database, usually generated incrementally. A primary key consisting of more than one column is commonly referred to as a **composite** primary **key**.

For example, an electronic commerce web site such as Amazon.com, of Seattle, CA, may have a relational database to...

...table would contain a data record or instance of data for a given object. The tables may include an ID **column** to **uniquely** identify each data record with an integer value and to serve as the tables, primary keys. Alternatively, the first name and the last name of a given customer may be used as a **composite** primary **key** in the customer's personal information table.

Data may be queried from a database using a standard application program interface@called...

Detailed Description

Detailed Description

... metadata identifier, and collection universal resource locator (URL).

A table in a DBS typically uses one or more columns to **uniquely** identify a record in the table. A **column** that **uniquely** identifies a record in the table is referred to as a primary key. Where two or more **columns** are used to **uniquely** identify a record, the **columns** are referred to as secondary keys, the combination of which form a **compound primary key**. The value of the primary key can represent a "real-world" value such as a social security number, or the...

...SPECIFICATION table is titled (for purposes of this example) "Person" and the second table "Purchases." In the Person table there are **three** columns: "Name", containing alphanumeric data; "State" containing two characters of alphanumeric data; and "Zip", which may be stored as five ...

...containing alphanumeric data; Product, containing alphanumeric data; and Quantity, containing numeric data.

Also, stored along with the database are the **primary keys** for each of the tables. In most database systems each row must be **uniquely** identifiable. One or more **columns** together create the **primary key** which when the contents of those **columns** are combined **uniquely** identify each row in the table. In the Person table above, the **column** Name is **unique** in each row and Name could be the **primary key** column. However, in the Purchases table, "Name" does not uniquely identify each row since there are multiple Johns and Pats. In that table, both the "Name" and "Product" **columns** together **uniquely** identify each row and together form the **primary key**.

In the above example, there is an implied relationship between the two tables based on the common column title "Name..."

Detailed Description

Detailed Description

... table is titled (for purposes of this example) "Person" and the second table "Purchases." In the Person table there are **three** columns: "Name", containing alphanumeric data; "State" containing two characters of alphanumeric data; and "Zip", which may be stored as five...

...containing alphanumeric data; Product, containing alphanumeric data; and Quantity, containing numeric data.

Also, stored along with the database are the **primary keys** for each of the tables. In most database systems each row must be **uniquely** identifiable. One or more **columns** together create the **primary key** which when the contents of those **columns** are combined **uniquely** identify each row in the table. In the Person table above, the **column** Name is **unique** in each row and Name could be the **primary key** column. However, in the Purchases table, "Name" does not uniquely identify each row since there are multiple Johns and Pats. In that table, both the "Name" and "Product" **columns** together **uniquely** identify each row and together form the **primary key**.
